# Exercises

## Resistor Revisited

# Exercises

## Resistor Revisited

1. Work through the resistor example by hand using $\hat{x}(0) = 100\Omega$, $\sigma = 0.1$, and $P(0) = 0$. Start the recursive loop with the gain equation first. Run through the loop three times.

# Exercises

## Resistor Revisited

1. Work through the resistor example by hand using $\hat{x}(0) = 100\Omega$, $\sigma = 0.1$, and $P(0) = 0$. Start the recursive loop with the gain equation first. Run through the loop three times.
2. How does the measurement model change when you add a second (but identical type of) voltmeter measurement?

# Exercises

## Resistor Revisited

1. Work through the resistor example by hand using $\hat{x}(0) = 100\Omega$, $\sigma = 0.1$, and $P(0) = 0$. Start the recursive loop with the gain equation first. Run through the loop three times.
2. How does the measurement model change when you add a second (but identical type of) voltmeter measurement?
3. How does the measurement model change when you add a second (but less accurate by 2x) voltmeter?

# Exercises

## Resistor Revisited

1. Work through the resistor example by hand using $\hat{x}(0) = 100\Omega$, $\sigma = 0.1$, and $P(0) = 0$. Start the recursive loop with the gain equation first. Run through the loop three times.
2. How does the measurement model change when you add a second (but identical type of) voltmeter measurement?
3. How does the measurement model change when you add a second (but less accurate by 2x) voltmeter?
4. Modify your own copy of run_avg_demo.py to add a small amount of process noise to the truth_vec truth model. Compare how well the running average performs compared to the Kalman filter in kf_resistor_demo.py using the statistically identical process noise. (Ensure measurement noise remains the same for both.)

## Constant Velocity Motion

5. Calculate the Kalman gain of the non-accelerated motion example. Hint: It looks a lot like the gain for the damped harmonic oscillator.

5. Calculate the Kalman gain of the non-accelerated motion example. Hint: It looks a lot like the gain for the damped harmonic oscillator.
6. Modify the measurement model in your own copy of constant_velocity.py by adding a velocity sensor. (Be sure to modify both the H and R matrices.)

5. Calculate the Kalman gain of the non-accelerated motion example. Hint: It looks a lot like the gain for the damped harmonic oscillator.
6. Modify the measurement model in your own copy of constant_velocity.py by adding a velocity sensor. (Be sure to modify both the H and R matrices.)
7. How do the dimensions of the Kalman gain matrix change after modifying the measurement model in the above manner?

5. Calculate the Kalman gain of the non-accelerated motion example. Hint: It looks a lot like the gain for the damped harmonic oscillator.
6. Modify the measurement model in your own copy of constant_velocity.py by adding a velocity sensor. (Be sure to modify both the H and R matrices.)
7. How do the dimensions of the Kalman gain matrix change after modifying the measurement model in the above manner?

8. By how much does the RMS error accuracy of the velocity estimation change with the addition of a direct velocity sensor?

5. Calculate the Kalman gain of the non-accelerated motion example. Hint: It looks a lot like the gain for the damped harmonic oscillator.
6. Modify the measurement model in your own copy of constant_velocity.py by adding a velocity sensor. (Be sure to modify both the H and R matrices.)
7. How do the dimensions of the Kalman gain matrix change after modifying the measurement model in the above manner?

8. By how much does the RMS error accuracy of the velocity estimation change with the addition of a direct velocity sensor?

# Exercises

## Damped Harmonic Oscillator

9. Modify the measurement model for the damped harmonic oscillator in your own copy of damposc.py by adding a direct velocity sensor.

# Exercises

## Damped Harmonic Oscillator

9. Modify the measurement model for the damped harmonic oscillator in your own copy of damposc.py by adding a direct velocity sensor.
10. By how much does the RMS error accuracy of the velocity estimation change with the addition of a direct velocity sensor?

# Exercises

## Damped Harmonic Oscillator

9. Modify the measurement model for the damped harmonic oscillator in your own copy of damposc.py by adding a direct velocity sensor.
10. By how much does the RMS error accuracy of the velocity estimation change with the addition of a direct velocity sensor?
11. Add a second sawtooth plot for the velocity state estimation uncertainty. How do the sawtooth patterns change with each of the mods above?
